DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Course: CSE 391
Name: Avinabo Tarafder
ID: 22101004
Email: avinabo.tarafder@g.bracu.ac.bd

Project Title: FitnessTracker

Project Features:

User profile management
Workout logging, including recording exercises
Calorie tracker
Weight tracker
Analytics, including graphs, records, and recommendations
Goal setting with notifications and reminders
Supplement and equipment store
Fitness-related query forum
Trainer request flow
Progress tracking dashboard

Future Enhancements:
Following enhancement can be added to the current system which will improve the system.

The future enhancements for the fitness tracker website will focus on three primary pillars: expanding the dashboard, enriching workout data, and advancing the analytics part. The dashboard will be overhauled to move beyond its current limited state, incorporating a broader range of high-level information and interactive features to provide a more comprehensive user overview. The workout section will be upgraded to include granular data points for every

exercise, specifically tracking caloric burn relative to duration, targeted body parts, and weight classifications to give users more precise insights into their physical activity. Finally, the analytics component will transition from limited datasets to a multi-dimensional data structure, allowing for complex cross-referencing of user metrics to drive deeper, more meaningful progress reports. The future enhancements for the fitness tracker website will focus on three primary pillars: expanding the dashboard, enriching workout data, and advancing the analytics engine. The dashboard will be overhauled to move beyond its current limited state, incorporating a broader range of high-level information and interactive features to provide a more comprehensive user overview. The workout section will be upgraded to include granular data points for every exercise, specifically tracking caloric burn relative to duration, targeted body parts, and weight classifications to give users more precise insights into their physical activity. Finally, the analytics component will transition from limited datasets to a multi-dimensional data structure, allowing for complex cross-referencing of user metrics to drive deeper, more meaningful progress reports. So, my website needs a lot of web developments related to polishing but to make it successful it needs to have more work on how and what to do with data.
